

Universe RP turns Jedi Academy multiplayer into a true sandbox for roleplay communities.

Every player has an account with characters that keep their level, skills, credits, sabers and looks. Chat carries as far as a voice would, with actions, descriptions, shouts, whispers and alien languages. Admins and builders shape the world in game: they place props, NPCs, lights and effects, lock doors to chosen players, and save it all for the next session.

The mod continues GalaxyRP by Alex, rebuilt to run natively on the modern TaystJK engine, on Windows, Linux and macOS, 32-bit and 64-bit, Intel and ARM.

What's new

- **Building in game.** New client-side menus to spawn MD3 and GLM props, place lights and FX runners, play music or sounds, and spawn NPCs or vehicles.
- **Entity tools.** Entity bounds display, and new commands to copy, cut and rotate entities.
- **Bigger entity system.** More entity classes, and a pool of logical entities that do not use up network slots.
- **Locks.** Doors and triggers can be locked per entity, with a list of the accounts allowed through.
- **Holograms and ghosts.** New hologram and ghost effects for players and NPCs.
- **Spawner settings.** NPCs and vehicles can be scaled on the go, given a team, and give XP and credits to whoever defeats them.
- **From the community.** RGB lightsabers, lightsaber holstering, hats and capes, for players and NPCs alike.
- **Single player maps.** Better support for SP maps, from both Jedi Academy and Jedi Outcast.
- **Radar.** A radar HUD in FFA. Cloak and mind trick hide players from it, and vehicles can cloak.
- **For roleplayers.** Custom animations, autowalk, lightsaber ignition fine tuning, an AFK protection bubble with animations, and much more.

GET IT

The download page picks the right files for your system, always from the latest release.

DOWNLOAD

Install and play

Universe RP runs on the TaystJK engine and your own copy of Jedi Academy. Four steps, about five minutes. The full guide is at praviilon.github.io/Universe_RP/play.html.

1 Install TaystJK

You need Jedi Academy itself: its `GameData/base` folder with `assets0.pk3` to `assets3.pk3`. Download TaystJK for your system from github.com/taysta/TaystJK/releases/latest (or from our download page) and extract it into `GameData`. Delete the OpenJK executables there first, or give TaystJK its own folder with a copy of `base`. TaystJK's install guide has the details for each system.

2 Add Universe RP

Download the Universe RP **Client** package for your system from praviilon.github.io/Universe_RP/download.html and extract it into the same folder. It holds one folder, `UniverseRP`, next to the TaystJK executable:

```
GameData/
├── base/                your Jedi Academy files
├── taystjk.x86_64.exe   the TaystJK engine
└── UniverseRP/
    ├── universe_rp_play.bat
    └── ...
```

3 Launch with the script

Start the game with the launcher in the `UniverseRP` folder: `universe_rp_play.bat` on Windows, `./universe_rp_play.sh` on Linux, `universe_rp_play.command` on macOS (right-click and Open the first time). Press Enter for the main menu, or paste a server's address to connect straight away.

4 Your first minutes

Open the console with ~ (or Shift + Esc). Make an account with `/new <login> <password>` and a character with `/char new <name>`. The Universe RP menu under Esc has your character, skills, shop, camera and the Extras; `/list commands` lists every command.

Hosting a server? Take the **Full** package instead and follow the server guide: praviilon.github.io/Universe_RP/host.html.

The mod is under development and open source, so anybody can contribute to it or build on its code. Feel free to post suggestions! Enjoy!
